### ABSTRACT

The interaction between plausib e combinations of levels of expenditures and revenues of the postanondary sector, 1975 - 1990, are examined in the main body of this report. The conclusions to be drawn from simulations may be summarized as follows: (1) Throughout the 1970's, incomes and expenses will be in balance in the entire postsecondary sector, on condition that private institutions continue to raise tuitions. (2) In the 1980's, a possible reluctance of legislators to provide sufficient money for the public sector vill cause its tuition and fees to grow faster than those of the private sector; (3) The growth of endowment and gift income among private institutions will allow them to moderate the growth of tuition during the 1980's, and will make it possible for them to keep their share of students. Appendixes include statistical data. (MJM)

### SUMMARY AND CONCLUSIONS

The financial difficulties of the post-secondary sector which became apparent towards the end of the 1960's became even more serious in the early 1970's. At the end of a ten-year cycle of expansion in enrollment, when the number of students increased by some eight per cent per year, the system appeared to have run out of steam to power its engine.

Between 1959-60 and 1969-70, the proportion of the population involved in post-secondary education more than doubled, expenses associated with instruction as a per cent of GNP increased by 175 per cent, state and local appropriations as a per cent of GNP increased by 250 per cent, and the bite of tuition and fees as a proportion of personal income doubled (see Table A).

TABLE A

INDEXES OF GROWTH OF THE POST-SECONDARY SECTOR

|         | Fall Enroliments (Per Cent of U. S. Population) | Total Expenditures for Instruction (Per Cent of GNP) | State & Local Appropriations (Per Cent of GNP) | Tuition & Fees (Per Cent of Personal Income) |
|---------|---|--|--|--|
| 1959-60 | 1.8   | 0.8  | 0.3  | 0.3  |
| 1965-66 | 1.3   | 1.3  | 0.4  | 0.5  |
| 1969-70 | 4.0   | 1.4  | 0.7  | 0.6  |

The financial stringency which affected all education during the past few years can be ascribed to a variety of causes. On the public side, the lower levels of economic activity put a strain on state and local resources as revenues fell short of what they might have been in a full-employment economy; and expenditures, especially those for social welfare, escalated faster than in the past. Increased support for higher education thus became a residual claimant, and could not muster the necessary political support in many state legislatures, especially after the rash of student riots on campuses. The enthusiasm of state legislatures for higher education support

became inversely proportional to the length of students' hair. Furthermore, many state reimbursement formulas were based on a perstudent basus, and thus relatively short-changed those universities and four-year colleges which expanded graduate and professional programs. By contrast, schools with tower outlays per student, e.g., junior colleges, fared better even in a period of tight money.

The more modest growth of enrollments in the private sector was sufficiently large to strain the limited resources, especially in the course of the past few years when private post-secondary institutions had to compete with the public sector. As the availability of public places increased, the amount of resources from endowments and gifts used to subsidize students in the private sector became crucial. Despite the fact that endowment and gift income throughout the 1960's increased as fast as the GNP, it had to be spread over an increasing number of students. In actual fact, the subsidy per FTE student in constant prices remained fairly stable during the past five years. Thus, the gap between public and private tuitions widened.

The strain on the finances of post-secondary institutions in both the public and private sectors was further aggravated by the relative decline in the role of research and development income and income from ancillary activities. The decline of these sources of funds was probably the coup de grace which destroyed the hairline balance between outlay and income for some types of post-secondary institutions.

The three years ending 1969-70, the last year for which financial data for the whole post-secondary sector is available, as well as the two years which followed, were certainly years of tight money. These conclusions are evident from the trend in instructional salaries, which increased very little, if at all, in real terms during the past five years. In a sense, the precarious balance in post-secondary budge's was made possible at the expense of earnings of the professional staff.

A policy of wage restraint, or to be more blunt, depressing real wages, could not have been instituted a few years ago when the demand for faculty was brisk. Since then, the lower levels of research and development outlays and the clower rate of growth in enrollments have accentuated an already serious employment problem for young Ph.D.'s. The plethora of applicants for academic jobs is likely to continue in the future.

The real imponderable is the extent to which the surplus of highly trained manpower is likely to spill over to persons with both bachelor's and master's degrees. Some preliminary studies conducted by our group indicate that a slackening of demand for all persons with college degrees is likely. By 1990, it is quite possible that

some five to ten per cent of college graduates may have to fill jobs which, up to now, were manned by persons with less education.

If this imbalance between supply and demand of college graduates occurs, the wages of persons with post-secondary degrees will be depressed relative to the rest of the labor force. It isn't clear whether this decline in relative wages will affect enrollments in the post-secondary sector. Higher propensities to enroll could be moderated or even reversed. Given these uncertainties, for this study we have adopted three different projections of possible enrollments for the period 1975 to 1990. The high enrollment projection was borrowed from the work of the Carnegie Commission on Higher Education; the median enrollment projection was based on a model developed by this writer at the U. S. Office of Education some years ago; and the low projection sets enrollments at ninety per cent of the median estimates.

All three enrollment projections agree that there will be virtual stability in enrollments in the 1980's. The highest, and in our opinion somewhat optimistic, projection predicts that 5.8 per cent of the total population will be involved in post-secondary education in 1980, and 5.2 per cent in 1990. It implies an increase of some 40 per cent over the 1970 participation rate by 1980, followed by a decline. The low projection anticipates a peaking of participation rates at 4.7 per cent in 1980, i.e., some 10 per cent above present levels, and a decline to present levels by 1990 (see Table B). In all cases, the rate of increase is less than that of the 1960's.

TABLE B

TOTAL ENROLLMENTS AND ENROLLMENTS AS PER CENT OF POPULATION FALL 1970, 1975, 1980, 1985, AND 1990

|      | Students<br>(Millions) | Per Cent of Population |
|------|------------------------|------------------------|
| 1970 | 8.6                    | 4.2                    |
| 1975 | 9.7 - 11.4             | 4.5 - 5.3              |
| 1980 | 10.6 - 13.2            | 4.7 - 5.8              |
| 1985 | 10.8 - 13.0            | 4.5 - 5.4              |
| 1990 | 10.6 - 13.0            | 4.2 - 5.2              |

Since expenditures in post-secondary institutions depend a great deal upon total enrollments, we estimated a range of total outlays required to educate the three projected levels of students. These costs will depend upon the mix of students between public and private institutions (since it costs roughly twenty per cent more to provide a year of instruction to a student in a private institution than in a publicly controlled school); the mix of students by type of school within each sector; and also the level of instruction - lower level or upper level undergraduate, professional, or graduate work. To a lesser extent, the expenditures also depend upon the course of study opted for by students. We estimated that a shift away from natural science to social science and the humanities could result in savings of roughly five per cent for the post-secondary sector.

On the whole, though, the level of outlays will be determined by the future level of instructional wages. Since professional wages account for 50 to 60 per cent of the total outlays for the post-secondary sector, assumptions about their future levels drastically affect all projections of expenditures. In this study, we projected three alternative levels of professional wages by rank; (1) the slow-growth rate of the past five years, referred to as the low-cost assumption; (2) the past ten years' trend, which is somewhat above the low-cost assumption, and is our median estimate; and (3) an increase at the same rate as per capita disposable income which produces the high-cost assumption.

An additional assumption was made about the effect on average wages of the change in mix of faculty by rank. There is little doubt that the slower growth of enrollments throughout the 1970's and their virtual stability in the 1980's will affect the mix by rank in the post-secondary sector. If an orderly promotion and retirement pattern, not unlike the one during the past ten years, is followed, the increased seniority of the faculty vill serve to raise the average level of wages some 20 per cent by 1990.

The professional wage bill for the post-secondary sector was calculated by taking into account increases in salaries by rank and the change in the rank mix. Even then, mean professional salaries under the low and median projections lag behind the increase in per capita disposable income. We believe that these assumptions are realistic because the increased competitiveness in the academic market will continue. The outlays for all instruction-related expenditures, which include not only professional wages but also other expenses such as libraries, etc., will probably increase at the same rate between 1970 and 1975 as they did between 1965 and 1970, i.e., some eight per cent a year. Beyond 1975, if costs grow at the median rates, instruction-related expenditures will increase by five to six per cent a year for the period through 1985, and some two to three per cent for the five years 1985 to 1990 (see Table C).

TABLE C
INSTRUCTION-RELATED OUTLAYS - MEDIAN ENROLLMENT, MEDIAN COST

|      | Total<br>(Billions of | Per C<br>of G |     | Annual Rate of Increase |
|------|-----------------------|---------------|-----|-------------------------|
|      | 1967-68 Dollars)      | High          | Low | for Past Five Years     |
| 1969 | 11.5                  | 1             | .3  | 7.9                     |
| 1975 | 17.4                  | 1.6           | 1.7 | 7.2                     |
| 1980 | 21.4                  | 1.6           | 1.7 | 4.2                     |
| 1985 | 25.8                  | 1.6           | 1.8 | 3.8                     |
| 1990 | 28.7                  | 1.5           | 1.7 | 2.2                     |

The projections of the possible level of revenue consist of separate projections of government appropriations, tuition and fees, endowments and gifts, and other miscellaneous income. Federal appropriations were assumed to stay at their present levels. By contrast, three separate projections of state and local government appropriations were prepared: it was assumed that (a) state and local contributions to higher education would grow in line with past trends, and amount to successively higher proportions of personal income; or (b) state and local funds would vary as a function of projected levels of personal income and the number of students enrolled; or (c) state and local authorities would continue allocating to higher education the same percentage of personal income in the future as they did in 1969-70.

We assumed that state and local appropriations will be distributed between public and private institutions in the same proportion as they have been to date, i.e., 94 per cent, the lion's share, going to the public institutions. The second projection, (b), is the one most likely to approximate future allocations of state and local public funds to post-secondary institutions, since the enthusiasm of state legislatures will be influenced both by the over-all affluence of the economy and the number of potential voters attending post-secondary institutions.

Two separate projections were prepared for future levels of tuition and fees. One is tied to past levels of tuition and disposable income, while the other projects the trend in tuition growth from 1965-66 to 1969-70. The projected levels of tuition are fairly close to each other in the private sector. In the public sector, tuition is

higher when projected on the basis of past trends than when tied to disposable income.

Finally, endowment and gift income was projected in relation to increases in the gross national product. Strangely enough, this relationship has held fairly closely in the past ten years.

The sum of all these revenue items and a small addition for other revenue (calculated as a percentage of the three revenue sources described above) made it possible to project the expected revenues of post-secondary institutions for the period 1975-1990.

A comparison of the possible levels of revenue and expenditures produced a series of findings which are counter-intuitive. most conceivable sets of circumstances, the crisis facing the postsecondary sector is likely to be attenuated in the next year or two. The specter of unbalanced budgets will not stalk the halls of postsecondary institutions for the remainder of the 1970's unless the salaries and wages of instructional staff start growing at a rate much higher than the one experienced during the 1960's. In the longer run, i.e., through the 1980's, the outlays and revenues of the postsecondary sector could also be balanced, on condition that salaries grow at either the low or median rate and tuition rates in public institutions increase in line with past trends, i.e., somewhat faster than disposable income. Our projections indicate that this balance could be achieved with government appropriations and tuition rates claiming roughly the same portion of GNP and personal income as they did in 1969-70.

If the revenues of private institutions follow past trends, surpluses rather than deficits may be the order of the day as long as enrollments in that sector are stable. According to our analysis, it is more likely that the budgets of private schools will be balanced, however, since increases in tuition and fees will be kept below the levels indicated by past trends. In order to remain competitive, it is quite likely that the private sector will have to moderate the rate of growth of tuition. Even with lower tuition throughout the 1980's, it will probably continue having trouble attracting a sufficient number of students to fill vacant spaces.

In the main body of the study and in the appendixes, we show the interaction between plausible combinations of levels of expenditures and revenues. The conclusions to be drawn from these simulations may be summarized as follows:

 Throughout the 1970's, incomes and expenses will be in balance in the entire post-secondary sector, on condition that private institutions continue to raise tuitions.

vii

- In the 1980's, a possible reluctance of legislators to provide sufficient money for the public sector will cause its tuition and fees to grow faster than those of the private sector.
- The growth of endowment and gift income among private institutions will allow them to moderate the growth of tuition during the 1980's, and will make it possible for them to keep their share of students.

The federal government will not contribute to maintaining the pluralistic character of the post-secondary sector by making grants to institutions on the basis of enrollment. On the contrary, the present legislation will probably serve to keep tuition down in both sectors, while favoring the public sector. Hence the struggle of private institutions to maintain stable levels of enrollments will be exacerbated. Since tuition and fees in the private sector will have to grow at a rather fast clip throughout the 1970's, increasing reliance will have to be placed on student-aid policy to keep the private sector viable. It may be worthwhile to re-think the existing policy of basic grants to students. The private sector would be helped if basic grants varied in some proportion to expenses actually incurred, and if students were offered the choice of borrowing the same percentage of their total expenses to attend either a public or a private institution.

In the 1980's, at the very time when some penury of public funds may manifest itself, the necessity of subsidizing private institutions will disappear. In these circumstances, per capita grants will not serve a constructive purpose either, and again considerable attention will have to be paid to student aid programs.

The projections presented in the body of this study and their numerous combinations and permutations will permit analysts to build alternative futures of the financial state of post-secondary education. Since we do not claim to be gifted with 20-20 foresight, we believe that a building-block approach is most useful for potential policy planners. We also believe very strongly that a word of caution about the use of the projections must be included. These projections are based on aggregative data, unfortunately of indifferent quality. Although great care has been taken to prepare consistent series, it may be well to test the reasonableness of the projections through a number of case studies of the finances of one or two state systems and a dozen private schools. Such case studies could breathe life into otherwise arid statistical simulations.

### INTRODUCTION

The projection of higher education costs for the next twenty years is complicated by the practically symbiotic relationship between costs and revenues. There is considerable evidence that institutions in the post-secondary sector will make do with as little, or spend as much, money as is made available to them. There are no generally accepted ceilings or floors for levels of expenditure per pupil, faculty workloads, or class size. In any given year, some institutions of a given type may spend four to six times as much per student as comparable institutions of the same type and size.

This diversity, illustrated in a number of startling graphs by the Carnegie Commission on Higher Education, 1 is fairly well accepted in the post-secondary sector. The ebb and flow of resources between individual institutions or types of institutions is a fact of life in the American post-secondary educational scene, and this state of events is considered natural. In the past, for instance, we witnessed periods of penury of public institutions and affluence of private ones. This situation is now reversed.

Despite the impressive volume of resources, which amounted to an estimated \$23 billion in 1971-72, relatively little analysis has been lavished on the finances of higher education institutions. A pioneering monograph by Bowen in the late 1960's, 2 a series of Carnegie

Commission monographs giving snapshots of finances of different types of institutions,<sup>3</sup> and a few analytic university-based studies of costs<sup>4</sup> are slim pickings to anyone interested in understanding the dynamics of higher education financing.

Projecting the expenditures and revenues of post-secondary institutions is, at best, a risky and ungrateful job. It is complicated by the absence of consistent data on the finances, resources, and outputs of the sector. The National Center for Educational Statistics (NCES) appears to take a delight in publishing non-comparable statistics from year to year. Unlike other well-disciplined federal agencies, the Center has not tried to build a bridge between one series and another. Adjustments from year to year have to be performed by individual researchers.

Coverage of post-secondary statistics is often such as to reduce their usefulness for researchers. For instance, the Center has failed to collect data on summer session enrollment in every year. While revenues and expenditures are collected on a full-year basis, students enrolled are reported either as of the opening fall enrollment, or only estimated for the regular year. Thus, in practice, most figures presented on the basis of full-time equivalent enrollment include a "load" for uncounted summer students. While this "load" may not be crucial in projecting future expenses, variations in summer session enrollment are likely to affect calculated past trends in costs.

As crucial as this shortcoming seems to be, it is dwarfed by the definitional problems for minor heads of expenditures and revenues reported by NCES. While there is considerable consistency in the more

important heads of expenditures (e.g., instruction and departmental research) and revenues (e.g., tuition and fees or state and local appropriations), other items appear to be recorded less accurately. Thus, considerable judgment about past levels of these outlays is required to decide how they will behave during the next 20 years.

Hence, it comes as no surprise that most existing projections of higher education costs rest on a thin reed. Some assume that costs will continue to increase at the same rate as they have in the past, while others assume that some savings will be effected as a result of the coming penury in post-secondary education.

We decided to undertake the present study because we believe that anticipating the levels of post-secondary budgets is crucial to the formulation of a comprehensive policy for higher education. Given the uncertain behavior of costs, we concluded that no single projection of future costs provides an adequate basis for a policy on how to finance higher education. There is far too much uncertainty about conditions, both within and outside the sector, which may affect both cost and demand for post-secondary education services. Hence, we believe that alternative projections which take into account the possibility of drastic change within the sector are needed to estimate the effect of desirable developments through public policies. In the second place, we intuitively feel that the financial conditions in the post-secondary sector are likely to be affected by social developments outside this sector and must be taken into account.

A new set of projections is especially timely, since many of the developments which will affect education costs and revenues have very little connection with the past. To mention just a few:

- (1) The sector is practically certain to stop growing, and may even start declining in the 1980's. Not only is the pool of young persons of college-eligible age going to shrink during the 1980's, but the propensity to attend post-secondary institutions will probably moderate. The supply of persons with advanced degrees has already outstripped the number of jobs which they could aspire to fill; and, similarly, it is quite likely that the supply of persons with four-year college degrees will soon exceed the number of job openings which were hitherto believed to be suitable for college graduates.
- (2) The easing of the supply of persons with advanced degrees has already affected the prices paid by the post-secondary sector for professional manpower, and it is reasonable to believe this trend will continue.
- (3) New arrangements for post-secondary instruction are more and more likely to supplement, and possibly supplant, institutions of post-secondary education as we know them. The system, which was originally designed to train an elite, has undergone some drastic transformations to become a mass dispenser of post-secondary training, and further adjustments of the system are likely to occur in the future.

At the very outset, we will try to summarize some salient developments in the financing of post-secondary education during the past decade. Later, we blend projections of trends with some subjective estimates of what may happen if demand and costs in the post-secondary sector diverge radically from previous trends. In the concluding section, we attempt to make recommendations to effect changes which will contribute both to the efficiency and to the financial health of the post-secondary sector.

### ENROLLMENTS AND TYPES OF STUDENTS IN THE 1960'S

As an introduction to the analysis and projections of this study, we believe it is necessary to comment briefly upon the way statistics of enrollments are collected in the post-secondary sector. Even the most obvious, and the seemingly simplest, classifications, hide some very real differences.

Traditionally, the post-secondary sector has been divided into public and private components. The public component consists predominantly of state-supported institutions, but does include a few which are supported by local governments. These institutions are not separately identified. Nor is any distinction made in the private sector between schools with strong religious affiliations, e.g., Catholic schools, and the rest of the private sector. It would be desirable to make such a distinction, especially in the case of Catholic schools, many of which have access to lower-paid instructors from religious orders.

Most published statistics further subdivide these sectors by types of institutions: universities, other four-year colleges, and two-year schools. It is generally assumed that universities cater to undergraduate and graduate students; four-year colleges to undergraduates and a small number of first professional students; and two-year colleges to freshmen and sophomores.

In actual fact, the situation is more complex. True enough, universities enroll undergraduates, graduates, and professional students. Even though their course offerings are the most

comprehensive, they offer very little instruction, during the ordinary school year, to either non-degree students or students in vocational programs. Four-year schools enroll an increasing proportion of graduate and first professional students in programs essentially leading to a master's degree. Two-year schools do not serve only as gateways to four-year institutions, but also expend a considerable portion of their resources on vocational and avocational degree courses.

The distinction between schools with and without graduate students is not made in any financial statistics published by the Department of Health, Education, and Welfare, U. S. Office of Education, National Center for Educational Statistics. A summary of the distribution of students by level of instruction, degree and non-degree status, and type of institution for Fall 1966 and Fall 1970, the latest year for which the detailed enrollment breakdown is available, appears in Table 1.

It should be noted that the year-to-year snapshots of enrollments reflect the classification of the school during the year when the enrollment was recorded. The classification of schools changes from year to year in the fluid and growing post-secondary sector. For instance, a number of teachers colleges with four year programs were upgraded during the past decade into four-year liberal arts schools; some liberal arts schools became more heavily committed to first professional and graduate training, but have not been reclassified by NCES.

### RECAPITULATION OF CURRENT EXPENDITURES AND REVENUES

The following exposition of post-secondary expenditures and revenues suffers from the sin of agglomeration. Unfortunately, the detailed records from which the data have been compiled are not available from the National Center for Educational Statistics.

Agreements with individual institutions to withhold data from public dissemination make it impossible to reclassify these statistics on a more rational basis.

We are thus constrained to present conglomerates of expenditures and revenues as they have been classified by NCES, and hope that these averages are representative of the class of institution which they purport to describe. Even in the case of agglomerated expenditures, the extent of detail reported varies between the first and second half of the 1960's, and classifications change from year to year.

In this study, we first present a longer series, starting with 1959-60, which we have tried to render comparable for the whole period; and second, a shorter series, 1965-66 to 1969-70, based on more detailed data, which is used to condense the expenditures and revenues related to the main function of the post-secondary system, instruction. These are the only years for which sufficient information exists to make this manipulation of data possible.

Expenditures. A series of tables (Appendix Tables 1.1 through 1.13) detail the gross expenditures of institutions of higher education as reported by special surveys of the Department of Health, Education, and Welfare, U. S. Office of Education, National Center for

Educational Statistics. The period covered by these tables is 1959-60 through 1969-70. During that period, total current fund expenditures of higher education more than tripled from \$5.6 billion in 1959-60 to \$21.2 billion in 1969-70. The last four years saw expenditures almost double from \$12.3 billion in 1965-66 to \$21.2 billion in 1969-70.

Despite the vast increase in the volume of expenditures, the relative importance of many budget items has remained fairly constant. Administration appears to have claimed about 10 per cent of all outlays, instruction and departmental research 30-32 per cent, plant operation and maintenance 7-8 per cent, and auxiliary enterprises some 16 per cent at the beginning of the decade and less than 14 per cent at the end.

As a general rule, administration claims a somewhat higher share of outlays in private institutions, as do auxiliary enterprises. By contrast, a slightly higher percentage of outlays is spent on instruction in higher education institutions in the public sector. Variations by type of institution from year to year are shown in the appendix tables cited above.

The expenditure item which showed the most significant change was organized research, which accounted for over 20 per cent of all outlays in 1963-64, and barely nudged 14 per cent in 1969-70. The decline was equally precipitous in both public and private sectors, but affected the economics of the private four-year schools most drastically. In the mid-1960's, organized and other reimbursed research accounted for roughly a quarter of all outlays in private institutions, and about a fifth of all outlays in public

institutions. Its share of total outlays declined by roughly one-third in both the public and private sector.

Research and development played an even more important role in universities, accounting for thirty per cent of all current outlays of private universities, and slightly more than a quarter of outlays in public universities during the first few years of the decade. By 1969-70, the role of research in total outlays of universities declined by six percentage points from the peak year. The most dramatic reduction of the role of research occurred in private four-year schools. At times during the 1960's, as much as a fifth of their expenditures was accounted for by research. By the end of the decade, research claimed less than one dollar in tweive of outlays in private four-year schools. Public four-year institutions and two-year colleges, which never participated actively in research activity, were not affected by changes in the distribution of research funding. Table 2 summarizes the peaks and troughs for expenditures in all institutions.

Revenues. The total current fund revenues of post-secondary institutions rose from \$5.8 billion in 1959-60 to \$21.6 billion in 1969-70. Throughout the period, for the post-secondary sector as a whole, roughly twenty per cent of the revenues was derived from student tuition and fees, and another thirty per cent came from government subsidies. These were the only two revenue items to exhibit relative stability during the decade.

By contrast, revenue from auxiliary enterprises, mostly dormitories and cafeteria facilities, provided a smaller and smaller share of the revenue. So did sponsored and separately budgeted

TABLE 2

research, which peaked in the middle of the decade, and then played a smaller role in total budgets in later years. Another revenue item which has played a smaller role in revenues is endowment and gift income, down from 10.2 per cent of the total revenues in 1959-60 to 5.0 per cent in 1969-70.

The stability or lack of stability in a number of the revenue items cannot be ascribed to any immutable laws governing post-secondary finance. It came about as a result of the combination of a variety of income patterns in the private and public sectors and government policies (especially in relation to research and development outlays).

Public contributions to total revenue increased from 56 to 64 per cent, paralleling the rise in public enrollments between 1959-60 and 1969-70. Since the proportion of revenues derived from student tuition and fees in public institutions is roughly one-third of what it is in the private sector, one would have expected tuition and fees to play a smaller role at the end, as compared to the beginning, of the period. However, it did not, because the role of tuition increased in both public and private schools and some other revenue items decreased.

The detailed breakdown of revenues by type of institution and by control appear in Appendix Tables 2.1 to 2.13. The changes in the role of various heads of revenue, displaying the peak and trough years for each, are summarized in Table 3.

Expenditures and Revenues for Instruction. Roughly a third of the activities of post-secondary institutions are only indirectly related to instruction. Thus, the higher education sector provides

research and development capability to the federal government and others, for which it gets reimbursed. A large number of institutions also provide dormitory and restaurant facilities, which are generally self-supporting, and are only incidental to the instructional activities at the institution. Lately, post-secondary institutions have also acted as pass-through agents for government student aid funds, and the receipts and disbursements for these moneys are to be found on both sides of institutional statements.

The analysis below nets out most items of expenditures and revenues which affect the instructional function only peripherally. Unfortunately, accounts of the post-secondary sector were not collected in sufficient detail during the first half of the decade, and the netting of receipts and expenditures could be done only for the period 1965-66 through 1969-70. Revenues and expenditures for instruction are presented in Appendix Tables 3.1 to 3.13 and 4.1 to 4.13.

The netting out of outlays and revenues does not significantly affect the relative rates of growth. Netted outlays grew some 75 per cent, while gross costs grew 72 per cent. Revenues on a netted-out basis increased by 71 per cent, as contrasted to 69 per cent of revenues on a gross basis. As could be expected, public sector revenues grew faster than private ones. Or a net basis, the increase was 86 per cent in the public sector and 46 per cent in the private sector. On a gross basis, public receipts increased 87 per cent, and private revenues grew 44 per cent.

Total Expenditures for Instruction. Probably the most significant development with regard to expenditures is that they

escalated faster than revenues, especially in the private sector.

By 1969-70, private universities and four-year schools were spending more than they were taking in on expenditures associated with instruction, and the proportion of funds from current revenue for capital additions had shrunk considerably in both the private and public sectors. The excess of expenditures amounted to \$39 million in private universities, and \$12 million in private four-year schools. Total revenues and expenditures for institutions and the resulting surplus or deficit are shown in Table 4.

Some 65-70 per cent of expenditures for all institutions is spent on administration and instruction, about 5 per cent on libraries, 11 per cent or so on operation and maintenance, some 4 per cent on student aid, and some 10 per cent on miscellaneous activities such as extension, related activities of education departments, etc.

During the period 1965-66 through 1969-70, there was considerable stability in most heads of expenses, i.e., they went up in concert from year to year. The two exceptions, as closely as we can determine, are the costs of administration, which trended up, and related activities, mostly cultural programs, which lost ground, suffering the fate of "frills" during a period of increased penury.

The instruction-related expenses look quite similar in the public and private sectors. In the public sector, 65 to 70 per cent is spent on administration and instruction. The expenditures of the private sector fall within the same range, with administration claiming a somewhat higher proportion of outlays and instruction correspondingly less. The share of outlays for

operation and maintenance and libraries is very similar for both sectors. It is true that the public sector spends more on related activities and extension, and the private sector spends more on student aid (seven per cent, as contrasted to two per cent in the public sector). In other words, the cost of ancillary activities is somewhat different in the two sectors, while core activities claim the same percentage of instruction-related expenses.

The similarity in expenditure patterns between the public and private sectors is evident in the universities. Both groups spend 60 to 65 per cent for administration and instructional activities, and about the same 11 per cent on operation and maintenance, and 5 per cent on libraries. The same differences in student aid found between the entire private and public sectors are also found in universities.

Other four-year colleges, both public and private also look very similar when administration and instructional expenditures are lumped. These two items of expenditure account for some 70 per cent of outlays related to instruction. It should be noted, though, that public schools spend about one out of six dollars for administration from this kitty, while private schools spend one out of four dollars for administrative causes. In private four-year institutions, outlays for libraries and maintenance claim a somewhat higher share, one per cent or more each, of the total instructional costs, with corresponding savings in extension and related activities.

The differences between the public and private institutions are more pronounced in the two-year college sector. Much more is spent on administration in private schools than in public ones.

Operation and maintenance also account for a bigger share in private schools. Since the private sector is tiny, not too much attention will be paid to these differences. More importantly, judging from expenditures, the two-year colleges spend 75 to 89 per cent for administration and instruction, about 10 per cent were of the total than other types of institutions.

Total Revenues for Instruction. Current fund revenues related to instruction, which amounted to \$7.9 billion in 1965-66, totaled \$13.5 billion by 1969-70. For all institutions, tuition accounted for roughly one-third of the revenues throughout most of the period. Government appropriations played an increasing role, accounting for 45 per cent of total revenues at the beginning of the period, and 51 per cent at the end. Gift and endowment income, by contrast, played a lesser role, losing slightly more than a percentage point of its share in revenues, and declining from 9.5 per cent in 1965-66 to just under 8.0 per cent in 1969-70.

These shifts in revenue sources only hint at the growing disparities between the public and private sector. While tuition accounted for only 18 per cent of the revenue in the public sector in 1965-66 and 19 per cent by 1969-70, it provided 60 per cent of the revenue in private institutions during the earlier year and 61 per cent in 1969-70. Endowment and private gifts, which accounted for roughly 20 per cent of all receipts in private institutions throughout this period, should be contrasted to government appropriations to public institutions, which increased from 69 per cent to roughly 74 per cent of total revenues. Thus, private institutions had

to make up a differential subsidy of some 50 to 55 per cent. Roughly two-thirds of this difference was made up through higher tuition, and the rest through other income.

Expenditures per Full-Time Equivalent Student. For the postsecondary sector as a whole, the per-student expenditure increased
29 per cent between 1965-66 and 1969-70. The costs escalated by
22 per cent in universities, 38 per cent in other four-year schools,
and 55 per cent in two-year schools, when both the private and public
sector are lumped. Costs per full-time equivalent student (FTE) rose
faster in private universities than in public ones, 33 per cent
versus 20 per cent. Costs increased 43 per cent in public other
four-year schools and 39 per cent in private other four-year schools
during the four years. Public junior college costs escalated fastest,
some 60 per cent, while private junior colleges increased their outlay
per student by 31 per cent.

If one lumps administrative and instructional costs on the one hand, and all other expenses on the other, both heads of expenditures appear to have increased at roughly the same rate in all institutions, with the exception of public universities. The savings in extension and public service and organized activities of educational departments helped offset price increases in libraries and maintenance.

The detailed presentation of expenditures and revenues per FTE is made in Appendix Table 5.1 to 5.13.

Revenues per Full-Time Equivalent Student. The disparities between the revenue patterns of the public and private sectors can be

highlighted even more meaningfully by examining the trends on the basis of full-time equivalent students. While tuition per FTE student escalated by \$126 per FTE student in five years for all institutions, amounting to an average of \$699 in 1969-70, the increase in dollar terms was \$99 in the public sector, and \$389 in the private sector. By 1969-70, the average tuition was \$379 in public institutions and \$1,537 in the private schools. The magnitude of the gap in tuition by the end of the decade amounted to roughly \$1,295 in universities, \$1,120 in other four-year schools, and \$761 in two-year colleges.

Standard Undergraduate Student Costs. While the full-time equivalent student costs give a rough idea of costs in the post-secondary sector, the changing mix of students between undergraduate, graduate, and first professional, by type of institution, tends to obscure some significant developments. For instance, the proportion of graduate students in the enrollment of other four-year schools increased significantly in the course of the past five years, and part of the increase in full-time equivalent cost is due to this change in the composition of the student body.

Another reason for the variation in associated costs is that price levels changed. As prices increased, so did the expenditures per student.

An understanding of the behavior of outlays can hence be enhanced (1) by adjusting expenditure figures for the mix of undergraduate/first professional/graduate students, and (2) by presenting the outlays in constant prices, so as to meutralize the effects of price fluctuations.

Outlays for instruction adjusted in this manner are shown in Table 7, pages 28 and 29. Below, we present a brief methodological exposition explaining how these adjustments were made.

The Concept of Standard Undergraduate Student. It is generally accepted that more resources are spent on students as they progress through school. Thus, it is cheapest to teach lower-level undergraduates, somewhat more expensive to provide instruction for upper-level undergraduates, and even more expensive to teach, or process, first professional or graduate students. Most expensive of all is the production of Ph.D.'s.

The difference by level of instruction has been recognized, but not thoroughly researched. Three state systems, Oklahoma, California, and Ohio, have collected a variety of figures on this topic, not necessarily in a uniform manner, and, according to the analysts who have compiled them, not necessarily with a great degree of precision.

The Oklahoma figures are rather old, and unfortunately are no longer collected. The statistics for the Ohio system are up to date, but are still in the process of being shaken down, and large unexplained variations appear from year to year. The California figures are the product of some five years' tracking by a group of most sophisticated analysts, both academic and in administration. This study has leaned heavily on the California estimates. The alternative Ohio figures were used to check the sensitivity of the estimates whenever differing weights were adopted. The results of the alternative calculations are also shown in Table 7, pages 28

and 29. The estimated weights by level of instruction are shown in Table 5.

The relative weights for lower-level undergraduates, upper-level undergraduates, etc., were used to construct an index of cost by control and type of institution. With only one observation to go on, the weight for first-professional students is simple. Undergraduate and graduate students require some adjustment by control and type of institution. The proportion of lower-level and upper-level undergraduates varies from school to school; the proportion of lowerlevel undergraduates is highest in private liberal arts colleges, and lowest in private universities. Hence, the level of effort expended on standard undergraduate students has to be slightly adjusted for this disparity, based on the distribution of Fall enrollment in 1970-71. In the case of graduate students, the proportion of graduate students studying for the Ph.D. is much higher in universities than in liberal arts schools. The proportion of graduate students by type of school and control was calculated by weighting Ph.D.'s granted by a factor of four, and master's degrees by a factor of 2.8 in 1968-69. The proportion of students in each program by level was used to derive weights to translate them into standard undergraduate students. These weights appear in Table 6.

Deflation of Instructional Outlays. As currently reported, instructional outlays consist of three major items: (1) salaries and benefits paid to instructional staff; (2) salaries and benefits paid to secretarial and clerical staffs supporting the instructional staff; and (3) support costs, outlays for supplies, telephones, etc., expended

by instructional departments. These conglomerate outlays are reported together by the U. S. Office of Education.

A review of available financial reports on file in the library of the National Center for Higher Education was used to estimate the share in each of the three components as follows:

| Instructional Salaries | 65% |
|------------------------|-----|
| Clerical Wages         | 20% |
| Support Costs          | 15% |

Given the spottiness of the data, it was not possible to break down this distribution of expenditure either by type or control of institution.

The total instructional costs were deflated as follows: (1) for the 65 per cent assumed to represent instructional wages, we used an index of instructional personnel salaries and wages based on the Association of American University Professors, weighting each rank by the distribution reported by U.S.O.E. in 1967-68; (2) clerical salaries were deflated by the appropriate clerical wage index of wages paid in 90 major metropolitan areas; and (3) other costs were deflated by the cost of living.

The resulting index was applied to costs in 1966-67 and 1969-70, using 1967-68 costs as a base, i.e., equal to 1.00. The index was .95 for 1966-67 and 1.13 for 1969-70.

Average Costs per Standard Undergraduate Student. Table 7 shows the costs per standard undergraduate student in 1966-67 and 1969-70. The per-SUS figures are in constant dollars, and present the

costs for roughly the same extent of effort. Two sets of estimates are shown. One is based on the factors adopted for this study, and the other uses the Ohio experience.

compared to cost estimates in terms of full-time equivalent students, the adjustment to standard undergraduate students shows a considerable narrowing of costs between types of institutions. True, universities still spent more in 1969-70 for instruction per student than either liberal arts colleges or two-year schools, especially if this study's estimates of comparative costs are used. But the differences practically disappear if administration and instruction are lumped, especially if the Ohio estimates are used. If administrative costs are added to the instruction costs, outlays per SUS do not appear to differ more than five per cent between most types of schools. This finding is significant if one is to project costs in the future. In other words, our projections of total expenditures in the post-secondary sector will not be affected crucially by errors in assigning students to different types of schools.

It will be noted that SUS costs do not vary significantly from one period to the next, with the exception of two-year public schools. The relative stability in universities was to be expected. The slight rise in costs in other four-year schools could be due to the costs of integrating faculty formerly used to do research and development, or may have been caused by start-up costs of graduate programs, which are ignored by our calculations.

The increase in two-year college costs is not unexpected. The growth of junior colleges from makeshift institutions manned by part-time faculty, to full-fledged adjuncts of the post-secondary system could not help but raise their costs. During the period 1968-69 to 1969-70, it appears that these costs have stabilized, and are not likely to grow as fast in the future.

The conclusion that costs of instruction and departmental research by type of institution adjusted for standard undergraduate students do not differ dramatically could also be inferred from June O'Neil's study for the Carnegie Commission on Higher Education. 6 Dr. O'Neil found that productivity of the staff in higher education remained fairly constant during the period 1930 to 1967.

#### THE METHODOLOGY OF LOOKING AT THE FUTURE

This study's projections of expenditures for post-secondary institutions are built up with the help of the following components:

- (1) three projections of the number of students by control and type of institution,
- (2) three levels of probable costs of instruction and departmental research, the major expenditure for instruction, and
- (3) other costs which were varied in proportion to instruction and department research outlays.

Revenue projections were derived from:

- (1) two estimates of tuition and fee income,
- (2) three levels of state and local government appropriations,
- (3) two levels of endowment and gift income, and
- (4) other income.

These estimates are combined to derive various combinations of expenditure and revenue, and draw conclusions about the financial health of the post-secondary sector.

Total Students. Since projections of cost depend to a large extent upon the number of students likely to be enrolled, it may be well to begin by discussing total enrollment levels, and then describe the assumptions used to distribute students by level of instruction and type of institution.

In this study, we have adopted three sets of enrollments: a high projection borrowed from Gus W. Haggstrom, 7 who prepared it for the Carnegie Commission on Higher Education; a median

projection based on a model devised by this writer for the Office of Program Planning and Evaluation of the U.S. Office of Education, 8 and a low projection set at 90 per cent of the median projection enrollment.

The Haggstrom projection is based upon an extrapolation of entry rates of high school graduates, a constant retention rate, and further extrapolations of graduate school attendance rates. Haggstrom also provides estimates of attendance for pre-baccalaureate students in all four-year institutions and two-year colleges, and an estimate of first professional students.

The OPPE model is based on (1) trending attendance rates of degree-credit students by income and ability quartile, and (2) assigning to them differential retention rates. It is limited to degree credit students, and does not attempt to project non-degree credit enrollment, which has been increasing at a faster rate than degree credit enrollment. Furthermore, it distinguishes only between undergraduate and graduate students, and does not single out estimates for first professionals. In this study, the model has been supplemented by an estimate of non-degree credit students taken from the NCES projections through 1980-81, and extrapolated beyond that date. Furthermore, the proportion of first professional students to graduates was trended up from 19.0 per cent in 1970-71 to 35.0 per cent in 1990-91, in line with past experience.

The low projection was set at 90 per cent of the enrollment of the median projection. A few informal calculations about the elasticity of demand for college education indicated that, should the

differentials between the lifetime earnings of high school graduates and the college-educated narrow, total enrollments could decline by some ten per cent. The decline, we believe, is likely to be proportional in each level of education throughout the 1980's.

After 1980, we decided to keep professional enrollments constant, at a level forecast by Haggstrom, and reduce projections of pre-baccalaureate and graduate students by the same ratio to fit the pre-determined totals of enrollment. This projection could be used to estimate possible savings if one assumed that some proportion of students were to receive their degrees through external examinations or other low-cost arrangements.

A comparison of total enrollments by level for the three projections appears in Table 8.

Full-Time Equivalent Students. The translation of total enrollment by level of student into full-time equivalent students was accomplished in the following manner:

- (1) The ratio of full-time to part-time students was calculated from fall enrollment statistics for 1970-71 for each type of institution by type and control.
- (2) It was assumed, in line with the practice adopted by NCES, that extension students attended school part-time.
- (3) The full-time equivalent of part-time students was set at one-third. This is the figure which has been customarily used for this purpose. It is based on a survey which is now five years old, and we took the opportunity of testing it by comparing the average number of credits carried in the Ohio State system with

- the appropriate estimates of full-time and part-time students. The estimate stood up to this test.
- (4) Since the full-time equivalent ratios for public and private universities for pre-baccalaureate and non-degree students are very close together, it was assumed that private two-year schools by 1975 would also start catering more energetically to part-time students, and by 1975 would have the same full-time equivalent factor as public two-year schools.

The conversion factors used to compute full-time equivalent students from total students are shown in Table 9.

Standard Undergraduate Students. Once projections of full-time equivalent students were made, the factors used to calculate standard undergraduate students in Table 6, p. 26, were applied to each group of students by level, by control and type of institution, to derive estimates through 1990.

Students by Control and Type of Institution. A variety of assumptions were made to distribute students by type of institution and control. For the high enrollment assumption, Haggstrom provides projections for two-year and other colleges, and does not distinguish between enrollments in public and private schools. Hence, we had to make a number of brave assumptions about the future of both the public and private sector. We kept the total enrollment in the private sector fairly constant in the high assumption in accordance with a statement found in the body of Haggstrom's paper. For the median and low assumptions, the share of the private sector was assumed to decline based on past trends. These trends were applied to enrollments by level of instruction.

Source: Adapted from U. S. Department of Health, Education, and Welfare, Office of Education, Fall Enrollment in Higher Education, 1970, Supplementary Information, Washington, D. C., U. S. Government Printing Office, 1971.

The distribution of students by level was accomplished in the following manner: (1) The proportion of FTE graduate students by type and control of institution was trended, based on the 1965-66 to 1970-71 experience. Estimates of the share of each type of institution by control are shown in Table 10. (2) The FTE equivalent of first professional students was estimated, and the growth in enrollments was allocated to institutions by type and control in proportion to the new places created during the past five-year period (see Table 11). (3) Remaining students, the pre-baccalaureate and non-degree student enrollment, were allocated consonant with variations in past shares of enrollment (see

These assumptions produced the following results:

(1) The proportion of total graduate students in private universities declines. (2) Most of the decline was offset by increases in professional enrollment. Both public and private four-year schools were projected to play a more important role in post-baccalaureate training. Professional education was likely to play an increasingly important part in private four-year schools.

The distribution by control and type of institution is presented in Tables 13, 14, and 15 for total students, FTE students, and SUS, respectively.

Future Costa of Instruction and Departmental Research. The following projections of expenditures for instruction and departmental research are in constant 1967-68 dollars, and are based on costs in 1969-70. These expenditures have two components. The first is tied to wage developments, accounting for 85 per cent of the total cost, and is allowed to vary as relative wages in post-secondary education rise without offsetting increases in productivity. The remaining 15 per cent are other costs which are assumed to remain constant.

Wage Developments. A rather elaborate series of adjustments was used to forecast future salaries and wages. Basically, the following assumptions were made:

- (1) Total wage costs for instruction will depend upon both future developments in wages and the rank-mix of the faculty. Possible changes in the mix will be discussed in greater detail below.
- (2) We believe that clerical and other wages will grow at the same rate as professional wages.
- (3) Other expenditures consist of items which are not likely to grow faster than the cost of living. If projections are made in constant prices, their absolute level per faculty member is likely to remain constant.

The first point above needs some elaboration. Because wages of instructional staff have not kept a set relationship either to total wage rates or to professional wages, nor followed a consistent time trend, a number of alternative assumptions can reasonably be made about the future development of salaries of instructional personnel.

In this study, we have adopted three projections of professional wages: (1) a low rate of increase of one per cent in

real terms per year, which mirrors the development of professional wages during the past five years; (2) an increase in real terms of two per cent a year, the rate at which wages increased during the past ten years (this is the median projection); and finally (3) a high projection, which caused wages to increase at 2.7 per cent a year, in proportion to the increase of per capita disposable income in the full employment GNP projection. This is the basis of the high cost projection. 10

The first three columns of Table 16 show the projected average wage for all faculty, assuming that the mix by faculty rank will remain at the 1967-68 level. In actual fact, there are good reasons to believe that the mix of instructors, assistant professors, associate professors, and full professors is likely to change quite drastically in the course of the next 18 years. The slowing down of the rate of growth of enrollments during the rest of this decade, and the virtual stability of enrollments during the next decade, will cause the average seniority of instructional personnel to increase considerably (see Appendix Table 10).

This increase in rank can only be estimated by simulating the increase in demand for different periods, retirements, resignations, and other attrition year by year. This is precisely what was done for this study. A simulation of promotions and attrition was run for each of the three enrollment estimates. It was assumed that there would be no significant changes in faculty/student ratios from the levels in 1967-68. Theoretically, attrition rates would be 2.5 per cent per year of professors, one per cent of associate

Salary Series adapted from AAUP Bulletin, Summer issues, 1962-1972; and U. S. Department of Health, Education, and Welfare, Office of Education, Higher Education Salaries, 1967-68, Washington, D. C., U. S. Government Printing Office, 1970; also see text. Source:

professors, three per cent of assistant professors, and fifty per cent of instructors. No national data on attrition exists; nevertheless, these assumptions are consistent with the experience of the California system. 12 Promotion rates assumed that one-sixth of those in subordinate ranks would be promoted each year.

The resulting simulations indicate that, after twenty years of virtual stability of enrollments, if wage rates did not change, the increased average seniority would cost post-secondary institutions 21-22 per cent more per faculty member than in 1967-68. During the intermediate years, the level of enrollments plays a more significant influence on the distribution by rank, and thus affects the projected salary levels more drastically. Thus, in 1975, the model estimates an increase in average salary levels over 1967-68 of 6.0 per cent with the low enrollment projection, but only 2.5 per cent with the high enrollment projection. Estimated salaries adjusted by the raises due to seniority are shown in the last three columns of Table 16.

The reasonableness of these assumptions can be gauged by comparing the relationship of salary estimates through 1990 to projected per capita income. For the next twenty years under the high GNP assumption, it would be possible under the high salary projection for professionals in the post-secondary system to gain somewhat in comparison to average per capita income; under the median salary projection, they would lose some 7.5 per cent; and for the low salary projection, the loss would amount to some 20.0 per cent. With the low GNP assumption, high salaries would result in a relative gain of 51 per cent, median salaries a gain of

some 24 per cent, and low salaries in a gain of six per cent.

(See Table 17.)

These figures indicate that it is reasonable to use

(1) high and median salary projections together with high GNP

projections, and (2) median and low salary projections with low GNP

projections.

Calculations of Total Instruction and Departmental Research Costs. The figures based on the 1969-70 standard undergraduate student costs were multiplied by (1) the estimated number of standard undergraduate students in 1975, 1980, 1985, and 1990; and (2) an index of projected increases in mean cost for instruction and departmental research. Since we estimated three possible trends in professional wage costs for the future, a low, median, and high index of future instructional and departmental research outlays was calculated by (1) applying the new index of professional salaries to 85 per cent of those costs and (2) keeping the viller 15 per cent constant, since the projections below are in 1967-68 prices. The index numbers derived from the high, median, and low projections for each level of enrollment appear in Table 18. It will be noted that they differ somewhat from each other, depending on the level of enrollments. These differences are due to the projected mix of faculty by rank, which in turn depends upon the growth of enrollments in previous time periods.

Projections of these costs are based on a series of assumptions which are not immutable. For instance, the projections presume that the mix between students taking degrees in science and

those taking liberal arts instruction will remain constant. It is quite possible that the mix of degrees will change, and in turn will affect costs. The majority of studies, such as the ones for the state systems of Oklahoma and Ohio, estimate that the cost of instruction in natural sciences is roughly 1.5 to 2.0 times the cost of instruction in social sciences and liberal arts. Currently, slightly over 20 per cent of all undergraduate degrees are conferred in the sciences. It is quite possible that, towards the end of the decade and in the 1980's, the proportion of degrees in the sciences will decline drastically. This trend already manifested itself during the late 1960's and the early 1970's.

We have attempted to estimate the savings from such a decline. The course of undergraduate studies consists of roughly 50 to 60 credits taken in a major or related field, while the remainder of the 130-credit requirement is generally part of a core curriculum. Hence, a degree in a natural science would cost some 20 per cent more to confer than one in some other discipline. If the number of degrees in science were to be reduced by one-half, i.e., from 20 to 10 per cent, roughly a two-per-cent saving in the under-graduate cost of instruction could be effected. The details underlying these calculations for each year appear in Table 19.

Similarly, in the case of graduate studies, if the disparity between natural science and non-science degrees is roughly 50 per cent, as it is on the undergraduate level, a decline from a

#### TABLE 19

quarter of graduate degrees granted in the natural sciences to, say, 10-12 per cent of the total would result in some savings. Graduate students take the lion's share of their courses in their major, and a halving of the share of science degrees could result in roughly an eight per cent saving in graduate programs. Again, the underlying ratios are shown in Table 19.

Another possible shift which may reduce the cost of graduate education is the change in the proportion of students enrolled in Ph.D. programs. Current projections of graduate costs are based on the assumption that the same proportion of students in graduate school will be enrolled in Ph.D. programs in the future as in 1969-70. If Ph.D. production remains fairly constant, say, 20,000 to 30,000 Ph.D.'s per year, some cost reduction in graduate programs can be anticipated. Since the cost of teaching Ph.D. students is roughly one-third higher than that of other graduate students, and graduate enrollments are projected to double by 1990, this shift would result in a decline of two to three per cent in the cost of graduate education.

degrees and a smaller production of Ph.D.'s could be estimated to reduce the cost of instruction by roughly five per cent. When these anticipated savings are applied to previous estimates of instruction and departmental research costs, they indicate the lowest level of instruction and departmental research costs which can reasonably be expected between now and 1990.

Other Costs Related to Instruction. Other costs related to instruction were scaled in proportion to instructional and departmental research outlays. The short discussion below explains the methodology of these estimates.

Administration. The costs of administration in relation to instruction and departmental research have shown a steady but slight increase for the post-secondary system as a whole. The behavior of these costs by type of institution and by type of control has been fairly erratic. We have investigated the causes of these fluctuations and have come to the conclusion that many of the zigs and zags in the series are due to difficulties in insuring consistent reporting of administrative expenditures from year to year. This difficulty is exacerbated by the practice of the National Center for Educational Statistics, which, since 1968-69, has lumped administrative costs with all other expenditures. Hence, it was decided that the 1969-70 costs, which had been estimated by this study with some care, would be used as a standard for the projection of administrative outlays in the future. Thus, a fixed relationship was projected for future years. It appears in Table 20, and summarizes the ratios adopted by control and type of institution for these and other costs.

Libraries. It appears that the levels of library budgets are set arbitrarily as a percentage of both instructional and departmental research outlays and administration. The considerable stability from year to year in the level of these outlays leads us to this conclusion. For instance, in the past, increases in either

TABLE 20

Source: Appendix Tables 3.1 to 3.13.

total or per FTE expenditures for libraries have had very little relationship to price developments for books and periodicals. These prices increased fifty per cent between 1965 and 1970, and doubled between 1960 and 1970. Yet, over-all library budgets quintupled in current prices between 1959-60 and 1969-70, increasing 2-1/2 times in constant prices. Between 1965-66 and 1969-70, they doubled in current prices, i.e., increased by two-thirds in constant terms. By contrast, the expenditures for FTE students decreased in real terms. It is not at all clear whether economies of scale or penury of funds have held back library expenditures. While complaints have been voiced that allocations for these purposes lack desirable levels in some institutions, it isn't certain that much will be done to change current methods of establishing library budgets. Hence, the previous five years' clationship between library expenses and instructional and departmental research outlays was used in the projections.

Non-Governmental Student Aid. Funds allocated to student aid from institutional resources (as contrasted to pass-through funds of federal and local governments) should more logically be tied to tuition, since most institutions set their budgets for this type of outlay relative to tuition collected. Fortunately, since tuition usually covers the same proportion of outlays in most years, and differs only by type and control of school, there was a relative stability in the amounts allocated to student aid, both as a proportion of the total expenditures and as a proportion of instructional and departmental research. Again, a five-year average

of past outlays by type and control of school was adopted for the purpose of projection.

Other Outlays. The average relationship of other outlays to instruction and departmental research was used to project these expenditures in the future. In most cases, this appeared to be a reasonable estimate. Many schools which were in financial straits have reduced these outlays below the levels of the mid-1960's, and it was believed desirable to assume for the purpose of our projections that modest levels of expenditures would continue.

Plant Operation and Maintenance. The estimated costs of plant operation and maintenance per full-time equivalent student in higher education are very close to the expenses per student incurred in the elementary and secondary sectors during a number of years for which information on these outlays was available in both sectors. In some ways, this is a stroke of good luck, since in another study we have examined the composition of these costs and projected future trends. 13

Differences in FTE costs by type of institution can be explained by the location of the institution; thus, operation and maintenance costs are higher in the Northeast, where many private liberal arts colleges are located. Other differences in costs per student are mostly due to the amount of space per student. In the past six years, these costs have grown at the same rate in all types of institutions. Also, for the few years for which per-student expenditures for operation and maintenance in post-secondary and elementary and secondary systems are available, it appears that costs

increased at the same rate. Thus, it is reasonable to project these costs in the same way that operation and maintenance were projected for elementary-secondary education. In other words, the real costs in constant terms were assumed to grow 0.7 per cent faster than the price index, and total costs per student were projected to grow at 2.2 per cent a year. Total cost increase per student was thus set at 2.8 per cent per annum. Figures in Table 21 reflect these assumptions.

Total Outlays Associated with Instruction. Total outlays associated with instruction have thus been constructed in two stages:

- (1) Instruction and departmental research costs were increased by a set percentage for each type of school by type of control according to the assumptions made above. (These assumptions are summarized in Table 20, p. 60.) For example, total instruction and departmental research in public universities is increased by 65.6 per cent, to arrive at the total cost of instruction less operation and maintenance.
- (2) Operation and maintenance of plant based on the estimated full-time-equivalent student was added to the figure above.

Total costs related to instruction are shown in Table 22. It contains 18 sets of estimates for every year. The first nine are based on three enrollment and salary levels, the second nine on the assumption that there will be a shift away from science and that the Ph.D. production will be set at a lower level.

## REVENUES

The projection of revenues deals in detail with estimates of

(1) tuition and fee income, (2) government appropriations, and

(3) endowment and gifts. These three items account for roughly

90 per cent of the revenues of the post-secondary system. The

"other" revenues are dealt with as a residual.

Tuition and Fee Income. Revenue from tuition and fees can be reasonably estimated in a number of ways. An obvious one is to tie the total to trends of what these revenues were in relation to disposable income.

For instance, the proportion of personal disposable income paid as tuition and fees in the post-secondary sector increased from roughly .30 per cent of the total disposable income in 1959-60 to close to .67 per cent in 1969-70. It would be reasonable to assume that the proportion of disposable income paid in tuition and fees will continue to increase at the historical rate. The reasoning underlying this assumption runs as follows: As the average affluence of the American population increases, it is only natural that a greater proportion of this increased affluence be spent on post-secondary education. If this trend is followed to its logical conclusion, in 1990 roughly 1.3 per cent of the disposable income in that year, amounting to 19-22 billion dollars (depending upon GNP growth) will be paid in tuition and fees (see Table 23). However, the assumption isn't a very good one. Not only is there evidence of

increasing resistance to high tuition and fees as an increasing number of undergraduates choose the lower-cost two-year institutions, but it is also highly unlikely that, given the smaller proportion of the total population who will be college students in the 1980's, an increasing amount of disposable income will be devoted to tuition.

Another assumption that the same proportion of disposable income will be spent on tuition and fees in the future as in 1969-70 is more plausible. If this assumption is followed to its logical conclusion, tuition and fees will amount to something between 9 and 11 billion dollars in 1990. The amounts for intermediate years are also shown in Table 23.

The range between the estimates presented in Table 23 depends not only on the level of the Gross National Product projection, but also on the decision as to what is the most likely propensity to buy higher education. Of the two projections, we believe that the lower approximates more reasonably the willingness of the public to pay tuition and fees. The higher projection (which, in effect, would make the post-secondary sector twice as reliant on tuition and fee income as it is today) would probably require considerably more generous financial assistance to students compared to today's standards.

While the projections shown in Table 23, especially the lower one, probably are a good indication of the amounts likely to be made available for tuition and fees, it seems more reasonable to adopt for purposes of projection somewhat different approaches to

forecasting tuition and fee levels, approaches which better simulate the behavior of institutions. Two such approaches are described below.

The first approach capitalizes on the remarkable stability of tuition and fees in relation to per capita disposable income during the past few years. This stability is illustrated in Table 24. Even in the case of the high-tuition institutions, i.e., private universities, the tuition and fees for FTE students amounted to 51 per cent of the per capita disposable income in 1965-66 and 54 per cent of per capita disposable income in 1969-70. We thus felt that it was more reasonable to set the possible growth of tuition and fees in proportion to average disposable income. For instance, we felt that public universities could get away with charging 16 per cent of the average per capita disposable income, while private universities would continue charging 53 per cent. Admittedly, this trend serves to widen the cost gap between public and private institutions. Nevertheless, such a widening is consistent with our enrollment projections, which assume that the share of enrollments of the public sector will increase from 72 to 87 per cent between now and 1990. The average levels of tuition and fees under the high and low GNP projections are shown for each five-year interval between 1975 and 1990 in Table 25. These figures were multiplied by the full-time equivalent student's in each of the three levels of the projections to arrive at estimates of tuition and fee receipts by Since the tuition and fee receipts depend not control of institution.

only on the level of enrollments, but on the level of the gross national product, a high and a low estimate were prepared for each period. (See Table 26.)

Another plausible assumption about the developments of tuition and fees is that they will grow at the same rate, in constant dollars, in the future as they have grown from 1965-66 to 1969-70. For the public sector, this would imply a constant dollar growth of tuition ranging from 6.2 per cent in two-year institutions to 4.0 per cent in universities, and from a decline of one per cent in private two-year schools to a growth of 3.4 per cent in private univers: 'es.

The private tuition per FTE under this set of assumptions is nearly the same as the one projected with the high GNP growth. By 1990, it is about 20 per cent higher than the tuition projected with the low GNP growth. Based on a continuation of 1965 to 1965 trends, by 1990 public tuition per FTE will be 35 per cent higher than the tuition projected with the high GNP growth, and 50 per cent higher than the tuition derived by using the low GNP figure.

Government Appropriations. The uncertainty about the future level of government appropriations for the post-secondary system is even greater than the uncertainty about the possible amounts levied in tuition and fees. One could assume that the same proportion of personal income would be earmarked by states and localities for post-secondary education in the future as in 1969-70. Alternatively, it is reasonable to believe that past trends will continue in the

future and that an increasing proportion of disposable income will be allocated to the post-secondary system via state and local grants (see Table 27). A predictive equation fitted to the past ten years data takes the following form:

$$App_{s1} = 14.96936(DI) - 3809.5625$$
 $(1.57538)*$ 
 $(436.0161)*$ 
 $R^2 = .9377$ 

\*Standard errors in this and other equations are in parentheses.

The equation fits past data extremely well, since the R<sup>2</sup> is in excess of .93. Despite the goodness of the statistical fit, there are some doubts that the past is a good predictor of the future. The reluctance of a number of state legislatures to meet cheerfully the demands of chancellors of post-secondary systems indicates that the 1970's and 1980's will be a period of increasing resistance to higher post-secondary subsidies by state and local governments. Even if the proportion of appropriations to personal income were to remain the same, state and local moneys would amount to roughly ten billion dollars by 1990. As will be shown below, this is quite an inadequate amount to meet the requirements for funds in the post-secondary sector. This projection is also shown in Table 27.

A somewhat more sophisticated model which takes into account not only the growth of personal income, but also the number of students enrolled in the public sector, provides projections which fall between the limits set by the first two assumptions.

Source: See text and Appendix Tables A-2 and 7.1 to 7.6.

The two variables used in the predictive equation are (1) total disposable income, and (2) the number of students in public institutions. In effect, it is assumed that the willingness of state legislatures to allocate moneys to public institutions depends on both the general affluence of the population and the number of voters being subsidized. The predictive equation based on the last decade's data is

Log App<sub>S1</sub> = 
$$.64229 (LogDI) + .94905 (LogENRpub) - 1.61589 (1.14864) (.73165)
 $R^2 = .9796$$$

Depending on the level of the gross rational product, disposable income will be between 11 and 13 billion dollars. Our projection estimates the amount which could then be reasonably provided by the legislatures by 1990 for the post-secondary sector. Intermediate years are shown in Table 27 as well.

In the case of federal grants, we have made the assumption that they will remain at the 1969-70 level. This assumption is based on our belief that subsidies to graduate students from federal sources will moderate and will not keep up with the growth of the gross national product. We decided not to postulate any per capita aid to post-secondary sectors in order to delay discussion of this topic to another section.

The total estimated federal and other government aid was allocated to the private and public sectors in proportion to the last five years' average shares. These shares have not varied significantly during that period.

Endowment and Gifts Income. Endowment and gifts in the postsecondary sector can either be unrestricted for current operations or restricted for student aid funds. A third type of endowment and gifts earmarked for capital expenditures is not covered by this study.

Despite the lackadaisical performance of endowment income, the total of both endowment income and gifts has followed very closely the trend of the gross national product. The forecasting equations used in this study to project future endowment and gift income are:

General gift and endowment:

$$GI_{EG} = .00158(GNP) - 153.8728$$
 $(.00009)$ 
 $(31.66524)$ 
 $R^2 = .9830$ 

Endowment earmarked for student aid:

$$SAI_{EG} = .00025 (GNP) - 43.21649$$
  
(.00001) (2.72461)  
 $R^2 = .9927$ 

It will be noted that the R<sup>2</sup> of each equation is very high.

Other more sophisticated equations were tried to fit future developments for this type of revenue. Adding the average unemployment rate to the average level of change in the Standard and Poor's stock market index did not improve the goodness of the fit. Although it is intuitively reasonable that both endowment income and gifts would be affected by the ebullience of the stock market, or by the general economic condition, past developments do not warrant the use of more sophisticated constructs. The level of the gross national

product appears to be a sufficiently sensitive indicator to explain the behavior of this series.

Under the circumstances, we have prepared two sets of estimates of the future trend in endowment and gifts. The first is tied to the high gross national product projection, while the second follows the course of the lower gross national product projection.

These estimates are reproduced in Table 28. The table further breaks them down between endowment and gift income likely to be received by public institutions and that benefitting the private post-secondary sector. This distribution was quite easy. The share of the total going to each sector has remained relatively constant in the recent past, and there is very little reason to anticipate that it will change in the future.

Other Income. Other revenues were projected on the basis of experience in 1968-69 and 1969-70. Based on the experience of individual types of institutions, these revenues average some 4.0 - 5.3 per cent of total revenues for public schools, and 8.4 - 10.3 per cent for private schools. Small fluctuations of these revenues will not influence the finances of higher education significantly.

Total Revenues by Sector. Estimates of total revenues by sector are shown in Table 29. The table simplifies the numerous permutations and combinations based on the variety of assumptions, and shows just a high and low figure for each year and level of enrollment.

## CONCLUSIONS TO BE DRAWN FROM SIMULATIONS

The results of simulations showing the surpluses or deficits of the public and private sectors are shown in Tables 30 and 31. A number of alternative balances have been struck:

- (1) Table 30 shows the deficits or surpluses in a slowgrowth economy, with instructional costs rising relatively slowly or at the median rate.
- (2) Table 31 shows what the balance between revenues and expenditures may be if the economy operates at a higher level of GNP growth, and costs rise at either the median or high rate.

The projections indicate that receipts and outlays will be in relative balance in 1975 and 1980, and that in 1985 and 1990 public institutions may be hard-pressed for funds, either in a slow-growth economy, or if salary costs are high even with the high GNP. Private institutions, on the other hand, will show a surplus of receipts over outlays in 1975 and 1980 under all cost assumptions, if they continue to raise tuitions; surpluses in the private sector will also occur in 1985 and 1990 under the low and median cost assumptions. Thus, the conclusions to be drawn from the results of the simulations are easier to comment upon if the period through 1980 is discussed first, and projections for the later years are discussed separately.

Projections for 1975 and 1980. The slowing down of the rate of increase of enrollments will certainly ease the financial problems of the post-secondary sector. Under most conceivable assumptions, even if the economy does not operate at full-employment

## TABLE 30 (Cont'd)

PROJECTED SURPLUS OR DEFICIT IN PUBLIC AND PRIVATE POST-SECONDARY INSTITUTIONS, GIVEN DIFFERENT LEVELS OF ENROLIMENTS, COSTS, GOVERNMENT SUBSIDIES, AND TUITIONS, LOW GNP GROWIH, 1975-76, 1980-81, 1985-86, AND 1990-91

(Billions of 1967-68 Dollars)

Revenues from government appropriations in public institutions consist of the following components: (1) a constant federal government appropriation and (2) three levels of state and local government appropriations, labeled A, B, and C.

State and local government appropriations are kept at the 1969-70 per cent of GNP (.67%). **A:** 

State and local government appropriations are a function of disposable income and enrollments in public institutions. ä

State and local government appropriations are trended as a function of disposable income for the period 1959-60 to 1969-70. ö

levels, a sufficient amount of money is likely to be raised for public schools throughout the decade of the 1970's.

Private schools, on condition they do not increase enrollments, will also be able to balance their outlays and revenues during that period. Yet, there are some indications that they may have trouble in keeping up their enrollments. As public places become more readily available, and tuition in public institutions remains quite low, the propensity to attend private schools may decline.

To a large extent, the size of the private sector depends on (1) its ability to offer more resources to a given segment of students who believe that they can benefit from these resources, and (2) the preference of a minority of post-secondary students who choose to attend smaller, more intimate schools. These preferences are exercised selectively, and probably depend very much on the price which has to be paid for the convenience or prestige of attending a private school.

The student in a private school can be likened to the buyer of a Cadillac at full list price, and the student in a public school to the purchaser of a Chevrolet at a discount from list. To illustrate this analogy: a \$7,000 Cadillac sells for its list price, a \$4,500 Chevrolet can be bought for \$3,600. If the values of the cars are proportional to their list price, a Cadillac buyer pays \$3,400 more for \$2,500 more car. In other words, he gets \$0.735 of car for every dollar he spends.

In 1965-66, the average expenditure per standard undergraduate student was \$1,318 in the public sector, and \$1,528 in the private sector. The respective levels of tuition in that year were \$294 in the public sector, and \$1,189 in the private sector. Thus, for \$210 more expenditures, the private school student was paying \$895 more. In other words, an undergraduate was getting \$0.234 for every additional dollar spent. By 1969-70, following this calculation, the private student was getting \$0.285 per dollar spent. Nevertheless, the share of the private sector declined both at the under-graduate and graduate levels.

In 1975, with the present trend in tuition, for the median cost, median projection of enrollments, the SUS costs are estimated at \$1,623 in the public sector, and \$1,961 in the private sector. The tuition projected for that year is \$444 for the public sector and \$1,670 in the private sector. For \$338 extra output, the private student is expected to pay \$1,226. This is a return of \$0.276 on the dollar. In 1980, a similar calculation produces a return of \$0.237 on the dollar (see Appendix Table 11).

By contrast, the graduate student, at 3.0 SUS costs, was getting \$0.70 to \$0.85 for each dollar of increased tuition in 1965-66 and 1969-70. In 1975 and 1985, unless private tuition rates are decreased, graduate students will be getting \$0.80 to \$0.90 on the dollar.

Thus, the problems of private schools are likely to continue for the next ten years, as they will be desperately fighting to maintain their levels of enrollment.

Some Policy Implications for the 1970's. The conclusions to be drawn from these projections are not encouraging:

(1) In order to protect enrollments in private schools, student aid formulas will have to be geared in such a way as to encourage students to attend private schools. The type of student aid given to veterans after World War II, when the government paid tuition and fees of students and provided them with a modest living allowance, would be ideal. By contrast, the present policy of providing a \$1,500 basic grant ceiling to needy students and encouraging them to borrow the difference makes attendance in private schools less attractive.

Of course, it is not at all clear to what extent easier credit terms may be accepted by students as a substitute for grants. If the assumption is made that students are as willing to borrow as to accept student aid, the prospects of private schools are somewhat brighter than we indicated. Intuitively, we believe that this is a wild assumption.

urgent today than they were during the 1960's. These grants are not likely to help the private sector in stabilizing enrollments, unless the allocations from non-federal government sources decline by the amount of the subsidy. If tuition rates are reduced by the same amount in both sectors, the ratio of "bang for the extra buck" in the private sector will not change. If, as is provided under present legislation, the subsidy is somewhat more per FTE in the public sector than in the private sector, the returns

from the extra advantage of attending the private sector will decrease.

The only condition under which per capita grants will benefit the private sector is if they are used (a) to reduce state appropriations for support of post-secondary education in the public sector, or (b) to reduce tuition in the private sector. Whether this state of affairs is likely to prevail, or whether state systems will decide to keep their tuition lower is impossible to forecast.

The Situation in the 1980's. A number of conclusions with obvious policy implications can be drawn from the results of these simulations for the 1980's:

- (1) In the long run, neither the public nor private sector can afford high rates of increases in salaries.
- (2) The public sector will be able to balance receipts and expenditures in the mid-1980's and later, if tuition rates either follow past trends or increase along with growth in per capita disposable income, on the condition that state and local governments do not tighten the purse strings when appropriating money for post-secondary institutions. In summary, the financial health of the public sector will depend to a large extent upon the condition of state government budgets. An easing of the pressures on state resources, either through revenue sharing or the federal assumption of some state burdens, e.g., welfare, could probably go a long way towards alleviating conditions in public post-secondary education.

(3) The financial resources of the private sector are less likely to be strained in the future as they are today, assuming that the private sector keeps its enrollments relatively stable. If tuition and fees increase at their past rates, the private sector will run slight surpluses until the middle of the 1980's, and by the last half of the 1980's will be able either to reduce the rate of increase in tuition and fees, or to enroll up to 50 per cent more students in a high GNP economy or 10 per cent in a low GNP economy than has been projected.

Alternative Outcomes of the Future of Post-Secondary Finances.

A number of alternative outcomes of the finances of higher education

can be visualized. Two in particular will be discussed.

1. Changes in Tuition and Fees. Tuition and fees in the public sector can rise faster than during the past period, and those in the private sector can grow somewhat more slowly than in the projection based on past trends. The required levels of tuition to balance outlay and revenue are shown in Table 32. 14

We believe that a slower growth of tuition in the 1980's is a must for the private sector. With fairly stable enrollments throughout this period, and the competition for students with the public sector, the lower level of tuitions will restore and slightly increase the comparative advantage which the private sector enjoyed at the end of the 1960's.

The problems of the public sector will be somewhat more difficult to solve. Our projections indicate that non-federal public funding is not likely to grow fast enough to cover the deficits of the

<sup>a</sup>See footnote for Table 30, p. 95.

public sector. It is quite possible that the deficits will be reduced as the expansion of science and Ph.D. programs is curbed; and modest increases in tuition, somewhat above past trends, will bring about a balance between revenues and outlays.

Another possibility is that the public sector will develop low-cost external programs to certify students during the 1980's. Financial imperatives to try alternative educational models will start building up in the mid-1980's. We are less sanguine about their blossoming in the present decade.

2. Shifts of Students Between the Public and Private It is possible that the private sector, enjoying a surplus of funds because of rising tuition and stable enrollments, will enroll more students than was projected. With the mix by level kept constant, the number of students and the reduction of public institution deficits can be calculated in a rough and ready manner. The figures are reproduced in Appendix Tables 13 and 14. Under the median cost assumptions and fast tuition growth, these shifts in students could reduce the 1985-86 pullic school deficits by 50 to 100 per cent, and virtually eliminate them by 1990-91. If tuitions do not grow as fast and private institution surpluses are lower, private schools could take fewer students with correspondingly smaller reductions in public deficits. Public school costs could also be cut by reducing the number of Ph.D. and science degree candidates. These reductions would also reduce public deficits.

Despite these benefits for public school finances, we consider this shift quite unlikely. Private schools are more apt to

use their surplus funds to slow the rate of tuition rise than to enroll more students.

Probable Trends in the 1980's. The conclusions to be drawn from this analysis are the following: (1) Tuition rates in private schools will not rise as much as was projected. Their anticipated surpluses will be partially wiped out, and private schools will not be able to accommodate many additional students.

(2) Even with reduced tuition, the returns from additional expenditures by private sector students will not look terribly attractive unless the tuition of public schools goes up faster than forecast.

(3) The tuition in public schools could increase faster than forecast, especially in the late 1980's, when state and local aversion to financing increased costs, without fast-growing enrollments, is likely to manifest itself.

Some Policy Implications for the 1980's. Given a reasonable level of effort by state and local governments, the possibility of public sector deficits argues for the revival of a federal subsidy per FTE. Even in the 1980's, this subsidy can only be defended as a device to keep tuition increases down below past trends. It cannot be justified on equity grounds, or on the basis that tuition, without the subsidy, would be claiming a disproportionately high proportion of disposable income.

If such subsidy were to be granted, its justification would be that, in the absence of such payment, public places would be reduced. In this event, a better way of helping public institutions would be to concentrate the aid on institutions which enroll marginal

students, those economically weakest and academically most disadvantaged. Ideally, the most efficient subsidy scheme would channel payments only to those institutions which practice open admission and set no limit on the size of their undergraduate class.

It should be noted that under all assumptions tuition and fees are allowed to rise at least as fast as the growth in disposable income. Under those circumstances, student financial aid policy will have to continue to play an important part in assuring the financial health of the post-secondary sector.

### CONCLUDING COMMENTS

The projections presented in this study indicate that the financial problems of the post-secondary sector will probably not be as acute in the near future as they have been in the past. For one thing, the slower growth of enrollments, followed by virtual stability, will enable schools to catch their breath. In the longer run, control of expenses in the public sector, or more generous subsidies to public post-secondary students, will be required to keep the post-secondary sector healthy.

In both the short and the long run, the ability of the private sector to maintain relatively stable enrollments may be questioned.

There is little doubt that the proportion of students in the private sector, both undergraduate and graduate, is affected by the availability of places in the public sector, rather than by relative differences in costs. As long as a student of a given caliber has the choice between equivalent institutions in the public and private sectors, and as long as there is any difference in cost, the public sector will win more often than not.

Given the fixed assets committed to private post-secondary schools, it may be desirable to protect the erosion of the absolute number of enrollees. Whether this could be done through selective student aid, or by limiting public places, is not clear.

Another policy issue which has been slighted so far is the financing of start-up costs for professional schools. We mentioned

that start-up costs of professional schools may be high. We foresee considerably higher enrollments in the professional field, and have heard reservations about the ability of some private schools to participate in meeting the newly created demand.

Finally, since all the conclusions above are based on aggregate data, we cannot overstress the point that a few relective case studies to corroborate or discredit these global projections may be desirable. In either case, they would breathe life into an otherwise dull array of statistics.

It should be emphasized that all the results above are based on the particular paths assumed for such variables as enrollment, GNP, and forecasts of legislative and private donations for post-secondary education. In addition, assumptions about structural factors, such as the particular mix of graduate degree intentions by type of institution (public versus private, four-year school versus university) also play an important part in determining the levels of outlay. But, within the range of the set of reasonable assumptions made here, it is apparent that the financial health of both public and private institutions need not be as great a topic of concern as it has been in the past decade.

- The tuition which balances current expenditures and revenues assumes that revenues will exceed current expenditures by five per cent to provide a small surplus for minor repairs and remodelling of the physical plant. This surplus was registered in most years during the 1960's.

### APPENDIX A

### PROJECTIONS OF GROSS NATIONAL PRODUCT

The simple model used in this study to project gross national product, personal income, and disposable income is based upon:

- (1) Projections of the U. S. population by age, Series E.
- (2) Labor force participation rates by age and sex, as projected by the Bureau of Labor Statistics.
- (3) A high (3.0 per cent) and a low (2.5 per cent) estimate of productivity.
- (4) Two assumptions about unemployment and/or hours worked. For the high GNP projection, it was assumed that unemployment would be at 4.0 per cent, and hours worked would decrease slowly, 0.2 per cent a year. For the low GNP projection, it could be alternatively assumed that hours worked would decrease faster, 0.4 per cent a year, or that unemployment would stabilize at a 6.0 per cent level.
- (5) The relationship between gross national product, personal income, and disposable income is that observed in the past three years. It assumes close to full employment, and relatively high levels of government expenditure.

The figures underlying the estimates are reproduced in Tables A.1 and A.2.

### APPENDIX TABLE A.1

TOTAL POPULATION, CIVILIAN LABOR FORCE, AND PRODUCTIVITY INDEXES USED TO PROJECT HIGH AND LOW GROSS NATIONAL PRODUCT, 1975, 1980, 1985, AND 1990

(Thousands of Persons)

|      |                  | Civilian    | Productivity<br>Indexes |       |  |

### LIST OF APPENDIX TABLES

- 1.1-13 Current Funds Expenditures of Higher Education Institutions, by Level of Institution and Control, Selected Years, 1959-60 to 1969-70
- 2.1-13 Current Funds Revenues of Higher Education Institutions, by Level of Institution and Control, Selected Years, 1959-60 to 1969-70
- 3.1-13 Current Funds Revenues and Expenditures for Instruction in Institutions of Higher Education, 1965-66 to 1969-70
- 4.1-13 Distribution of Current Fund Revenues and Expenditures for Instruction in Institutions of Post-Secondary Education by Control and Level of Institution, 1965-66 to 1969-70
- 5.1-13 Current Funds Revenues and Expenditures for Instruction per Full-Time Equivalent Student in Post-Secondary Institutions, 1965-66 to 1969-70
- 6.1-3 Total, Full-Time Equivalent (FTE), and Standard Undergraduate (SUS) Students, by Control and Type of Institution and by Level of Instruction
- 7.1-6 Total Students by Control and Type of Institution and Level of Instruction for Three Enrollment Projections for Fall 1975, 1980, 1985, and 1990
- 8.1-6 Projected Full-Time Equivalent Students by Control and Type of Institution and Level of Instruction for Three Enrollment Projections for Fall 1975, 1980, 1985, and 1990
- 9.1-6 Projected Standard Undergraduate Students by Control and Type of Institution and Level of Instruction for Three Enrollment Projections for Fall 1975, 1980, 1985, and 1990
- Per Cent Distribution of Faculty by Rank for Three Enrollment Projections, Actual 1967-68 and Projected 1975-76, 1980-81, 1985-86, and 1990-91
- 11.1-2 Ratio of Additional Expenditures per Student to Each Dollar of Higher Tuition Paid in Private Post-Secondary Institutions, Given Alternative Levels of Enrollment, Government Appropriations, and GNP Growth, 1975-76, 1980-81, 1985-86, and 1990-91

### LIST OF APPENDIX TABLES (Cont'd)

- 12.1-3 Projected Tuition and Fees per Full-Time Equivalent Student Required to Balance Revenues and Expenditures in Public and Private Post-Secondary Institutions, 1975-76, 1980-81, 1985-86, and 1990-91
- Possible Affordable Increase in Enrollments in Private Institutions, under Alternative Levels of GNP, Enrollment Cost, and Tuition, 1985-86 and 1990-91
- 14.1-4 Reductions in Public Institution Deficits from Increased Enrollments in Private Schools, under Alternative Levels of GNP, Enrollment, Cost, Tuition, and Government Appropriations, 1985-86 and 1990-91

### APPENDIX TABLE 1.13

CURRENT FUNDS EXPENDITURES OF HIGHER EDUCATION INSTITUTIONS, BY LEVEL OF INSTITUTION AND CONTROL, SELECTED YEARS, 1959-60 TO 1969-70

(Percent Distribution of Expenditures by Purpose, Dollars in Millions)

#### Footnotes

- a Included in "Other."
- hospitals, federally funded research and development centers, etc. It is not possible to allocate these expenditures exactly to the categories reported for 1959-60 to 1967-68. It was assumed that federally Beginning in 1968-69, expenditures were requested separately for major public service programs, i.e., funded research and development centers are in "Organized Research" and that other public service is included in the "Extension & Public Service" category. Ω,
- Includes sales and services of educational departments, other sponsored programs, and other educational and general expenditures, as reported for each year. U
- d Not reported separately.

Columns may not add due to rounding.

Data for 1959-60 and 1965-66 to 1969-70 are from U. S. Department of Health, Education, and Welfare, Office of Education, Financial Statistics of Higher Education, appropriate years; for 1961-62 and 1963-64, Higher Education Finances, Selected Trend and Summary Data, Washington, D. C., Government Printing Office. Source:

RATIO OF ADDITIONAL EXPENDITURES PER STUDENT TO EACH DOLLAR OF HIGHER TUITION PAID IN PRIVATE POST-SECONDARY INSTITUTIONS, GIVEN ALTERNATIVE LEVELS OF ENROLIMENT, GOVERNMENT APPROPRIATIONS, AND GNP GROWTH, 1975-76, 1980-81, 1985-86, AND 1990-91

\*See footnote, Table 30, p. 95.

.

Differences in expenditures are for median cost assumptions; differences in tuition are for tuitions required to balance revenues and expenditures. Note:

PROJECTED TUITION AND FEES PER FULL-TIME EQUIVALENT STUDENT REQUIRED TO BALANCE REVENUES AND EXPENDITURES IN PUBLIC AND PRIVATE POST-SECONDARY INSTITUTIONS, 1975-76, 1980-81, 1985-86, AND 1990-91

(Constant 1967-68 Dollars)
